Práctica 12. Multiplicación de Matrices N x M y M x R

U.A.Q. Fac. de Informática

Dra. Sandra Luz Canchola Magdaleno

Correo: sandra.canchola@uaq.mx

Dra. Reyna Moreno Beltrán

Correo: reyna.moreno@uaq.mx

Sean A una matriz tamaño n x m y B una matriz de tamaño m x r, la multiplicación está definida como:

$$A_{n \times m} * B_{m \times r} = AB_{n \times r}$$

$$(AB)_{i,j} = \sum_{k=1}^{m} a_{i,k} + b_{k,j}$$

$$A_{3\times3} = \begin{bmatrix} 1 & 5 & 2 \\ 0 & -2 & 3 \\ 4 & 1 & 0 \end{bmatrix} \qquad B_{3\times4} = \begin{bmatrix} 2 & 1 & 3 & 1 \\ -1 & 2 & 0 & 1 \\ 3 & 4 & 0 & 5 \end{bmatrix}$$

$$AB_{3\times4} = \begin{bmatrix} (1*2) + (5*-1) + (2*3) & (1*1) + (5*2) + (2*4) & (1*3) + (5*0) + (2*0) & (1*1) + (5*1) + (2*5) \\ (0*2) + (-2*-1) + (3*3) & (0*1) + (-2*2) + (3*4) & (0*3) + (-2*0) + (3*0) & (0*1) + (-2*1) + (3*5) \\ (4*2) + (1*-1) + (0*3) & (4*1) + (1*2) + (0*4) & (4*3) + (1*0) + (0*0) & (4*1) + (1*1) + (0*5) \end{bmatrix}$$

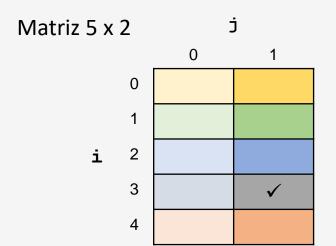

$$AB_{3\times4} = \begin{bmatrix} 2-5+6 & 1+10+8 & 3 & 1+5+10 \\ 2+9 & -4+12 & 0 & -2+15 \\ 8-1 & 4+2 & 12 & 4+1 \end{bmatrix} = \begin{bmatrix} 3 & 19 & 3 & 16 \\ 11 & 8 & 0 & 13 \\ 7 & 6 & 12 & 5 \end{bmatrix}$$

Índice de elementos

```
indice=(i*numCol*numProf)+(j*numProf)+k
Ejemplo:
mat2[1][1][2]
indice=(1*2*4)+(1*4)+2=14
```

Proyecto CUDA

Proyecto CUDA

Operaciones de memoria (CPU)

```
• malloc.- Reserva un bloque de memoria de un tamaño definido de bytes,
retornando un apuntador al inicio de dicho bloque. El contenido de dicho bloque
no se inicializa por lo que es indeterminado. Ejemplo:
       void* malloc (size t size);
       buffer = (char*) malloc (sizeof(char)*100);
• memset. - asigna valores en secciones de memoria. Ejemplo:
       Memset (variable, valor a asignar, tamaño de memoria)
       Donde: tamaño de memoria se define como n * sizeof(tipo)
• memcpy. - Copia el contenido de un bloque de memoria referenciado por un
apuntador a otro apuntador. Ejemplo:
       void* memcpy( void* dest, const void* src, std::size t count );
       memcpy (ptrDest, ptrOrigen, sizeof(int)*100);
• free. - Liberar la memoria reservada con el comando malloc. Ejemplo:
       free(pointerName);
       free (array2);
```

Operaciones de memoria (GPU)

• cudaMalloc. - asigna una sección de memoria en GPU de acuerdo con el espacio solicitado. Ejemplo: cudaMalloc((void**) & apuntador, tamaño de memoria) Donde: tamaño de memoria se define como n * sizeof(tipo) • cudaMemset. - asigna valores en secciones de memoria. Ejemplo: Memset (apuntador, valor a asignar, tamaño de memoria) Donde: tamaño de memoria se define como n * sizeof(tipo) • cudaMemcpy. - copia memoria hacia y desde el device. Ejemplo: cudaMemcpy(destino, origen, tamaño de memoria, indicador flujo de inf) Donde Indicador = cudaMemcpyHostToDevice, cudaMemcpyDeviceToHost, cudaMemcpyDeviceToDevice • cudaFree.-libera la memoria reservada por un apuntador. Ejemplo: cudaFree (apuntador)
